proteins. The PRO proteins have cytostatic activity. The PRO proteins can be used for targeted delivery of bioactive molecules, such as can be used for targeted delivery of bioactive molecules, such as sequences, radiolabels or antibodies, that cause cell death. PRO nucleotide sequences, and their fragments, can be used as hybridisation probes, in chromosomal and gene mapping, and in the generation of anti-sense RNA and DNA. They may also be used to produce transgenic animals which are used to develop and screen therapeutically useful reagents: The PRO nucleotide and protein sequence can be used for tissue typing and in treating cancer. Anti-PRO antibodies can be used in diagnostic assays. AAF44270 to AAF44470 represent PCR prinars and hybridisation probes used in the isolation of human PRO sequences. AAF44087 to AAF4259 and AAB65154 to AAB65300 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Application US/08740223A

Patent No. 6265564

GENERAL INFORMATION:
TITLE OF INVENTION: Expressed Ligand - Vascular
TITLE OF INVENTION: Intercellular Signalling Molecule
NUMBER OF SEQUENCES: 28
CORRESPONDENCE ADDRESS:
ADDRESSEE: Regeneron Pharmaceuticals, Inc.
STREET: 777 Old Saw Mill Road
CITY: Tarrytown
STATE: NY
    SYSTEM: PC-DOS/MS-DOS
PatentIn Release #1.0, Version #1.30
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              154 NQTSRLEI-----QLLENSLSTYKLEKQLLQQTNEILKI 187
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2 NQESKLIILASGGPQALVNIMRTYTYEK-LLWTTSRVLKV 40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MEDIUM TYPE: Diskette
COMPUTER: IBM Compatible
OMPERATING SYSTEM: DOS
SOFTWARE: FastESO Version 2.0

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Cell. Physiol. 181:258-272(1999).

-!- FUNCTION: INVOLED IN THE REGULATION OF CELL ADHESION AND IN SIGNAL TRANSDUCTION THROUGH THE WIT PATHWAX (BY SIMILARITY).

-!- SUBUNIT: THE CYTOSOLIC FORM BOUND TO AXIN ALLOWS THE STIMULATION OF ITS DEGRADATION. THE CYTOSOLIC FORM ALSO INTERACTS WITH APC AND E-CADHERIN. THE NUCLEAR FORM BINDS TCF/LEF. I AND MAY ALSO BIND PONTINS AND DUFLIN. CAN HETERODIMERIZE WITH ALPHA-CATENIN AND ALSO FORM A TRIMERIC COMPLEX WITH CADHERIN. MEDIATES THE ANCHORAGE OF THE CACHERIN COMPLEX TO THE CORTICAL ACTIN CYTOSKELETON (BY

                                                                                                                                                                                                                                          -i- FUNCTION: COMMON JUNCTIONAL PLAQUE PROTEIN. THE MEMBRANE-
ASSOCIATED PLAQUES ARE ARCHITECTURAL ELEMBRIS IN AN IMPORTANT
STRATEGIC POSITION TO INFLUENCE THE ARRANGEMENT AND FUNCTION
OF BOTH THE CYTOSKELETON AND THE CELLS WITHIN THE TISSUE. THE
PRESENCE OF PLAKOGLOBIN IN BOTH THE DESNOSOMES AND IN THE
INTERNEDIATE JUNCTIONS SUGGESTS THAT IT PLAYS A CENTRAL ROLE IN
THE STRUCTURE AND FUNCTION OF SUBMEMBRANOUS PLAQUES.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TINDER SURFACE OF DEVELORMENTAL INFORMATION. CAN ASSOCIATE WITH CADAL ALL STATILLING HER STEADHED SIGNALING. ARM FUNCTION IN WG SIGNAL TRANSDUCTION IS REQUIRED SIGNALING. ARM FUNCTION IN WG SIGNAL TRANSDUCTION IS REQUIRED THE CNS AND EPIDERMIS.

1. SUBCELLULAR LOCATION: CYTOPLASMIC AND MEMBRANE-ASSOCIATED WITH THE CNS AND EPIDERMIS.

1. SUBCELLULAR LOCATION: CYTOPLASMIC AND MEMBRANE-ASSOCIATED WITH THE INNER SUFFACE OF CELL MEMBRANE.

1. SUBCELLULAR LOCATION: CYTOPLASMIC AND MEMBRANE-ASSOCIATED WITH THE SUFFACE OF CELL MEMBRANE.

1. SUBCELLULAR LOCATION: CYTOPLASMIC SPLORM IS PREDOMINANT BEFORE GERM BADD RETRACTION, AFTER RETRACTION AND DURING LARVAL STAGES, IT IS FOUND IN HIGH LEVELS IN SPECIFIC CELLS ALONG THE CNS MIDLINE.

2. TISSUE SPECIFICITY: CYTOPLASMIC ISOFORM IS PREDOMINANT BEFORE GERM BAND RETRACTION IN THE CNS MIDLINE.

3. SOFORMS ATTER SEEN AFTER GERM BAND RETRACTION IN THE CNS MIDLINE.

4. TISSUE SECRIFICATE OF THE CNS, ALSO PRESENT IN AXONS DURING LARVAL STAGES

AND ACCUMULATES IN THE PNS.

5. SOFORMS AND ACCUMULATES IN THE PNS.

5. HIGHEST LEVELS DURING EARLY TO MID-EMBRYOGENESIS.

6. HIGHEST LEVELS DURING EARLY TO MID-EMBRYOGENESIS.

7. PTM: PHOSPHORYLATED ON SER, THR AND TYR RESIDUES. LEVEL OF FROM PARLES BOTH DURING EMBRYONIC DURING MEMBRY AND FROM PARLES BOTH DURING EMBRYONIC DURING MEMBRY AND PROPERMY AND SERVER THE POSTURES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This SWISS-PROT entry is copyright. Megulation of angiopotetin-2 mRNA levels in bovine microvascular endothelial cells by cytokines and hypoxia.";

endothelial cells by cytokines and hypoxia.";

Circ. Res. 83:852-859(1998).

-1-FUNCTION: BINDS AND ACTIVATES TIES RECEPTOR BY INDUCING ITS TYROSINE PHOSPHORYLATION. IMPLICATED IN ENDOTHELIAL DEVELOPMENTAL PROCESSES LATER AND DISTINCT FROM THAT OF VEGF. APPEARS TO PLAY A CRUCIAL ROLE IN MEDIATING RECIPROCAL INTERACTIONS BETWEEN THE ENDOTHELIUM AND SURROUNDING MATRIX AND MESENCHYME. MEDIATES BLOOD VESSEL MATURATION/STABLLITY. IT MAY PLAY AN IMPORTANT ROLE IN THE HEART EARLY DEVELOPMENT.

-1-SUBCELLULAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

-!- FUNCTION: BINDS AND ACTIVATES TIEZ RECEPTOR BY INDUCING ITS
-!- FUNCTION: BINDS AND DISTINCT FROM THAT OF VEGF. APPEARS TO PLAY A PROCESSES LATER AND DISTINCT FROM THAT OF VEGF. APPEARS TO PLAY A PROCESSES LATER AND DISTINCR RECIPENCAL INTERACTIONS BETWEEN THE SUDDITIONS BETWEEN THE STUDY STATEMENT OF VESSEL MATURATION STABLISTY. IT MAY PLAY AN IMPORTANT ROLE IN THE HEART EARLY DEVELOPMENT (BY SIMILARITY).
-!- SUBCRELLUTAR LOCATION: Secreted.
-!- DEVELOPMENTAL STAGE: FOUND TO BE EXPRESSED THROUGHOUT THE OVARIAN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TISSUE-Cvary; ...

-1- FUNCTION: BINDS AND ACTIVATES TIEZ RECEPTOR BY INDUCING ITS TYROSINE PHOSPHORYLATION. IMPLICATED IN ENDOTHELIAL DEVELOPMENTAL PROCESSES LATER AND DISTINCT FROM THAT OF VEGF. APPEARS TO PLAY A CRCIAL ROLE IN MEDIATING RECIPROCAL INTERACTIONS BETWEEN THE ENDOTHELIUM AND SURROUNDING MATRIX AND MESENCHYME. MEDIATES BLOOD VESSEL MATURATION/STABILITY. IT MAY PLAY AN IMPORTANT ROLE IN THE HEART EARLY DEVELOPMENT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          TISSUE=Bone marrow;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Agents for treating human diseases, particularly cancer, modulate interaction of beta-catenin with transcription factors or tumor

· .

Example 4; Figus; 16pp; German.

suppressor gene products

```
This invention describes a novel agent (A) for treating human disease which is based on substances (I) that modulate (inhibit or promote) the interaction of beta-catenin with transcription factors or products of tumor suppressor genes. The invention also describes (a) peptides (II) comprising part of the LEF-L/TCF+4 transcription factors, or their comprising part of the LEF-L/TCF+4 transcription factors, or their carmaillo domain (arm units 3-8) of beta-catenin, and mutants of the complete beta-catenin molecule, that include at least one of the complete beta-catenin molecule, that include at least one of the specific interaction domains for LEF-1, TCF-4, APC, conductin or specific interaction domains for LEF-1, TCF-4, APC, conductin or screening substance libraries for compounds that modulate interaction of screening substance libraries for compounds that modulate interaction of sea key compound in the Wnt signalling pathway and is involved in beta-catenin with LEF-1/TCF, APC, conductin or E-cadherin is oncogenic but interaction with APC, conductin or E-cadherin is oncogenic (A) which inhibit interaction are particularly used to transcribe themselved to the colon and melanoma, but also, treat tumors, especifically carcinoma of the colon and melanoma, but also, where they promote interaction, to stimulate regeneration of organs and the catenin armadillo repeat fragments described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              modulator; interaction domain; transcription factor; TCF-4; oncogenic; tumor suppressor gene; conductin; E-cadherin; screening; carcinoma; APC; wnt signalling pathway; tumor development; anti-oncogenic; melanoma; organ regeneration; tissue regeneration; hair growth; mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Beta-catenin; human; armadillo repeat; treatment; human disease; LBF-1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Agents for treating human diseases, particularly cancer, modulate interaction of beta-catenin with transcription factors or tumor

This, invention, describes a novel agent (A) for treating human disease this, invention describes a novel agent (A) for treating human disease which; is based, on substances (I) that modulate (inhibit or promote) the interaction of beta-catenin with transcription factors or products of comprising part of the LEF-1/TCE-4 transcription factors, or their comprising part of the LEF-1/TCE-4 transcription factors, or their comprising part of the LEF-1/TCE-4 transcription factors, or their complete beta-catenin molecule, that include at least one of the complete beta-catenin molecule, that include at least one of the complete beta-catenin solered; the left of normal of left of the colon and melanoma, but also, there they promote interaction, to stimulate regeneration of organs and tissues, specifically hair growth, AAY3230-Y33241 represent mutant the left of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The patent discloses a method of female primate contraception comprising administering an antagonist of a Wnt polypeptide, inhibiting occyte development. Wnt polypeptides are useful for promotive maturation of an immature occyte. Wnt polypeptides are also useful for increasing the number of mature occytes and to enhance occyte viability. Soluble fragments of Wnt polypeptides have the ability to inhibit Wnt signalling, e.g., by blocking binding of a naturally-occurring Wnt protein to its receptor. They may be used to generate monoclonal antibodies which can inhibit occyte development. The present sequence is the human beta-catenin protein. Dominant negative mutants of beta-catenin lack one
                                                 Beta catenin is a member of the catenin family of cytosolic proteins and a key member of the Wnt signalling pathway. Catenins interact with the cytoplasmic domains of cadherin glycoproteins, and are important in maintaining cell adhesiveness; The loss of cell adhesiveness is implicated in metastasis. Beta catenin is also known as cadherin-associated protein and is implicated in colorectal cancer and melanoma. The present sequence is the human beta catenin protein. The coding sequence of this protein was used in the present invention to design antisense oligonucleotides (AAA5827-AS8366). The oligonucleotides are capable of hybridising to human beta catenin, in order to inhibit expression of human beta catenin. The oligonucleotides may be used in gene therapy for colorectal cancer or melanoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Contraceptive composition for inhibiting oocyte development in a female
                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 and polynucleotides (II). (I) and (II) are useful for treating inflammatory conditions such as arthritis, nephritis, Crohn's disease, ischaemia reperfusion injury, shock, sepsis, immune responses, and is involved in increasing haematopoiesis, stem cell survival, bone growth and remodeling. (I), (II) and modulators of (II) are useful for prophylaxis or treatment of one or more cancers. (II) is also useful for creating transgenic animals useful for studying the in vivo activities of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to novel isolated human secreted polypeptides (I)

```
the polypeptide as well as for studying modulators of the polypeptides.

(1) induces the proliferation of neural cells and regeneration of nerve

CC and brain tissue and is useful for the treatment of central and

peripheral nervous system diseases and neuropathies, such as Alzheimer's,

CC parkinson's disease, Huntington's disease, and amyotrophic lateral

CC sclerosis. In addition, (I) is involved in chemotactic or chemokinetic

CC activity, regulation of haematopolesis and is useful for treating mayeloid

CC or lymphoid cell disorders, platelet disorders such as thrombocytopenia

CC and for regeneration of bone, cartilage, tendon, ligament and/or nerve

CI stague growth, and in tissue repair, healing of burns, incisions,

CL incers, for treating osteoporosis, osteoarthritis, bone degenerative

CL disorders or periodontal disease. Furthermore, (I) is also useful for

GL sorders, or periodontal disease. Furthermore, (I) is also useful for

CL disorders including severe combined immunodeficiency (SCID), bacterial or

CL disorders including severe combined immunodeficiency (SCID), bacterial or

CL disorders including severe combined immunodeficiency (SCID), bacterial or

CL disorders including severe combined immunodeficiency (SCID), bacterial or

CL disorders including severe combined immunodeficiency (SCID), bacterial or

CL disorders including severe combined immunodeficiency (SCID), bacterial or

CL disorders including severe combined immunodeficiency (SCID), bacterial or

CL disorders including severe combined immunodeficiency (SCID), acterial or

CL disorders including severe combined immunodeficiency (SCID), and and conditions, carbohydrate, vitamins, minerals, provides

CC reactions and conditions, carbohydrate, vitamins, minerals, provides

CC diservity and can act as an antigen in a vaccine composition to raise an

CC minume response. AAUSBOSD-AAUSBOSS represent novel human secreted protein

The present invention relates to a method for in vitro expansion of mammalian stem or progenitor cells, which comprising increasing the intracellular concentration of beta-catenin in a progenitor or stem cell of mammalian concentration of beta-catenin in a progenitor or stem cell of which of which expanded sufficient for the progenitor or stem cell to divide. The number of cells having the functional phenotype of the stem or progenitor cells; aspanded. The method is useful for culturing stem cells and progenitor cells, which retain their pluripotential phenotype after expansion, in vitro. The expanded cell populations are useful as a source of stem cells, e.g. to reconstitute function in a host that is deficient in a particular cell lineage or ineages. The expanded cell populations are also useful in transplantation to restore haematopoletic function to autologous or alignment of approach to the cellplants. The present sequence is human beta-catenin projetin. Beta-catenin is a pivoal player in the signalling pathway in this account of a several developmental
                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method for in vitro expansion of mammalian stem or progenitor cells, which comprising increasing the intracellular concentration of beta-catenin in a progenitor or stem cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       In vitro expansion of mammalian stem or progenitor cells, useful for producing cells that retain their pluripotential phenotype after expansion for use in transplantation, involves increasing the levels of

```
in an in vitro culture medium for a period sufficient for the progenitor or stem cell to divide. The number of cells having the functional phenotype of the stem or progenitor cells is expanded. The method is useful for culturing stem cells and progenitor cells, which retain their pluripotential phenotype after expansion, in vitro. The expanded cell populations are useful as a source of stem cells, e.g. to reconstitute function in a host that is deficient in a particular cell lineage or lineages. The expanded cell populations are also useful in transplantation to restore haematopoietic function to autologous or allogeneic recipients. The present sequence is mouse beta-catenin protein. Beta-catenin is a pivotal player in the signalling pathway initiated by Wnt proteins, which are mediators of several developmental

Novel polypeptides and nucleic acids obtained from cDNA libraries prepared from various human tissues, for diagnosis and treatment of cancer, neurological, inflammatory, and autoimmune disorders -

```
Inflammatory conditions such as arthritis, nephritis, cronn's olsease, cischaemia-reperfusion injury, shock, sepsis, immune responses, and is involved in increasing haematopolesis, stem cell survival, bone growth and candeling. (1); (11) and modulators of (11) are useful for creating transgenic animals useful for studying the in vivo activities of creating transgenic animals useful for studying the in vivo activities of creating transgenic animals useful for studying the in vivo activities of creating transgenic animals useful for studying modulators of the polypeptides. (1) induces the proliferation of neural cells and regeneration of nerve and brain tissue and is useful for the treatment of central and coering the proliferation of neural cells and amyotrophic lateral extractions of slesase, Huntington's disease, and amyotrophic lateral coering sclerosis. In addition, (1) is involved in chemotactic or chemokinetic sclerosis. In addition, (1) is involved in chemotactic or chemokinetic cor lymphoid cell disorders, platelet disorders such as thrombocytopenia and for regeneration of home, cartilage, tendon, ligament and/or nerve cellsorders, or periodontal disease. Furthermore, (1) is also useful for treating osteoporosis, osteoarthritis, bone degenerative disorders or periodontal disease. Furthermore, (1) is also useful for ceperfusion injury in various tissues, various immune deficiencies and clisques including severe combined immunodeficiency (SCID), bacterial or fungal infections, autoimmune disorders e.g. multiple sclerosis, creations and conditions, such as asthma or other respiratory problems. In addition, (1) affects biorlythms or circadian cycles of rhythms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              fertility, metabolism, catabolism, anabolism, storage or elimination of dietary fat, lipid, protein, carbohydrate, vitamins, minerals, provides analgesic effects or other pain reducing effects, immunoglobulin like activity and can act as an antigen in a vaccine composition to raise an immune response. AAU28020-AAU28395 represent novel human secreted protein
                             The invention relates to novel isolated human secreted polypeptides (I) and polynucleotides (II). (I) and (II) are useful for treating inflammatory conditions such as arthritis, nephritis, Crohn's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cellular receptor 2; CR2; binding site; BS; auto-immune disease;

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention 1 useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA, sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL1675) and the encoded proteins The Sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the wipo int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid detection reagent for detecting 1000 or more genes, from Drosophila and for elucidating cell signalling and cell-cell interactions
                                                                                                                                  igolated nucleic acid detection reagent for detecting 1000 or more strom Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The ligand pref. includes a fragment indicated in the features, or the total protein. The ligand pref. contains only a single BS and has an amino acid sequence <100 (pref. <20) residues in length. The ligand may also comprise a plurality of fragment 389..394. A therapeutic compsn. contg. the polypeptide is used to stimulate or inhibit B lymphocyte proliferation in patients with B cell lymphocyte and myeloma's can be stimulated in patients with immunodeficiencies and immunoglobulin secretion by hybridoma cultures can be boosted. The compsn. can be administered to inhibit infection in vitro or in vitro by Professioners view of the compsn.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Drosophila; developmental biology; cell signalling; insecticide; pharmaceutical.

capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                              specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               detection reagent for detecting 1000 or more for elucidating cell signalling and cell-cell

The human APC-2 gene (AAA08835) is located at chromosomal position 19p13.3. The APC-2 tumor suppressor gene controls the Wnt pathway by the formation of a complex with GSK-3b, axin/conductin and beta-catenin, inducting the rapid degradation of the latter. The APC-2 polynucleotides are used for the diagnosis (claimed), prevention and treatment of cancer. They are also used for the recombinant production of APC-2 proteins. The methods are used to identify candidate drugs (claimed), especially for use in the treatment of cancers, preferably a fetal cancer, cancers with a stem cell phenotype, brain, lung, kidney or intestinal cancer (all

The present invention describes a method (M1) for identifying a substance that inhibits the interaction of a viral protein (VP) with a substance that inhibits the interaction of a viral protein (VP) with a host cell protein (HP). The method comprises: (a) contacting HP with VP in the presence of a test substance; and (b) detecting complex formation, where the ability of the test substance to inhibit HP/VP interaction is indicated by a decrease in complex formation. The antitizinal compounds in the interaction between a host protein (NSI-BP or NBI-1) and a viral protein (NSI) are useful for treating or inhibiting viral compounds include peptides and antibodies. In particular Antiviral compounds include peptides and antibodies. In particular compositions comprising a polypeptide containing an amino acid sequence corresponding to the NP-NLS domain of the influenza virus NP protein, which inhibits the specific interaction of the NPI-1 protein with the influenza viral infection in humans. The present sequence represents influenza viral infection in humans. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

GENERAL INFORMATION:
APPLICANT: Palese, Peter
APPLICANT: O'Neill, Robert
TITLE OF INVENTION: COMPOUNDS THAT INHIBIT INTERACTION OF HOST CELL PROTEINS
TITLE OF INVENTION: AND VIRAL PROTEINS REQUIRED FOR VIRAL REPLICATION
NUMBER OF SEQUENCES: 15
CORRESPONDENCE ADDRESS:
ADDRESSEE: PENNIE & EDMONDS
STREET: 1155 AVENUE OF THE AMERICAS
CITY: NEW YORK
CITY: NEW YORK
